Subject: Optimum Case Drain Port Change

Date: August 14, 2019

URL: www.munciepower.com

All Muncie Optimum pumps/motors are currently going through an in-line change. Back in 2016, additional business opportunities requested that the case drain port on all Optimum shaft end covers be changed from SAE -4 to SAE -6.

Rather than having two sets of shaft end covers, it was decided to go with the SAE -6 size case drain port across the board. This will prevent any mix ups, confusion and or manufacturing delays.

At the time this change was implemented, our inventory levels of the SAE -4 port size end covers were quite high and rather than create any confusion, we held off making this announcement. These inventory levels have since been or will shortly be used up and you will now begin to see covers with the SAE -6 case drain port.

The cover part numbers will not change and all of our literature is currently being updated to reflect this new port size.
